

## Section : . Penyimbolan

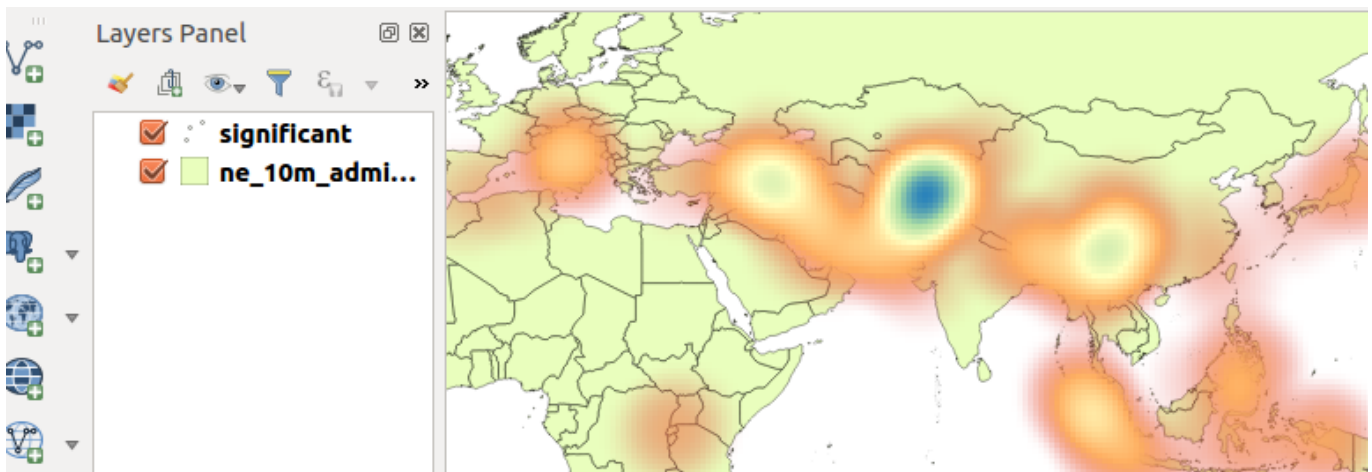

### Module : . Heatmaps

#### Heat maps in Context

*“Heat map visualizes hotspots in the distribution of features on the map i.e. dense areas will be highlighted in a heat map, based on the parameters you use for processing it”*

In this module, we explore heat maps as a point symbolisation technique.

#### You try:

**Goal:** To learn creating heat maps as a symbolisation technique

**Data:** heatmaps/earthquake.csv and ne\_10m\_admin\_0\_countries from heatmaps/ne.sqlite.

- Load the earthquake layer as a spatial layer.
- Load the ne\_10m\_admin layer
- Change the country layer transparency as specified
- Change the layer order to put the point layer on top
- Open the properties of the point layer and click the style tab.
- Change to the specified render type
- Choose the specified colour ramp
- Apply the changes and observe the map
- Why does the whole map colour change?
- Edit the colour ramp. Make colour 1 transparent.
- Apply the changes and observe.
- Open the properties of the point layer and change rendering quality to fastest. Observe the changes.
- Change the weight points by option to use the specified attribute.

NB: What can you infer about the intensity of the heat map in relation to deaths?

Name	Expectation
Render	Heat map

Country transparency	70
Colour ramps	Spectral
Attribute	Deaths

### More about

Heat maps use colour to communicate relationships between data values that would be difficult to understand if presented numerically in a spreadsheet or attribute table. A colour ramp helps to visualise a heat map with low values having colours at the bottom of the colour ramp and high intensity values corresponding to darker values on the colour ramp.

### Check your knowledge:

- When would it be useful to use a colour ramp:
  - To depict how a player was behaving during a soccer match.*
  - To show that the layer being represented is a vector layer.*
  - Heat maps can also be applied to raster data.*
- Which statement is false:
  - A colour ramp is used to show variation in a phenomena of interest*
  - Heat maps are extensively used by scientist*
  - Heat map points can be weighted by a discrete column*
- A colour ramp is a type of vector analysis:
  - True*
  - False*
